Second focal plane Nightforce™ SHV™ riflescopes

FORCEPLEX™ design quickly brings your eye to target
0.125 MOA thick center crosshair provides precise aiming point
Excellent in low light situations

Outstanding performance for both quick, close-in shots and at long ranges

Red indicates illuminated portion of reticle

Applications:
General hunting
Varmint shooting
Target shooting

RETICLEFORCEPLEX™

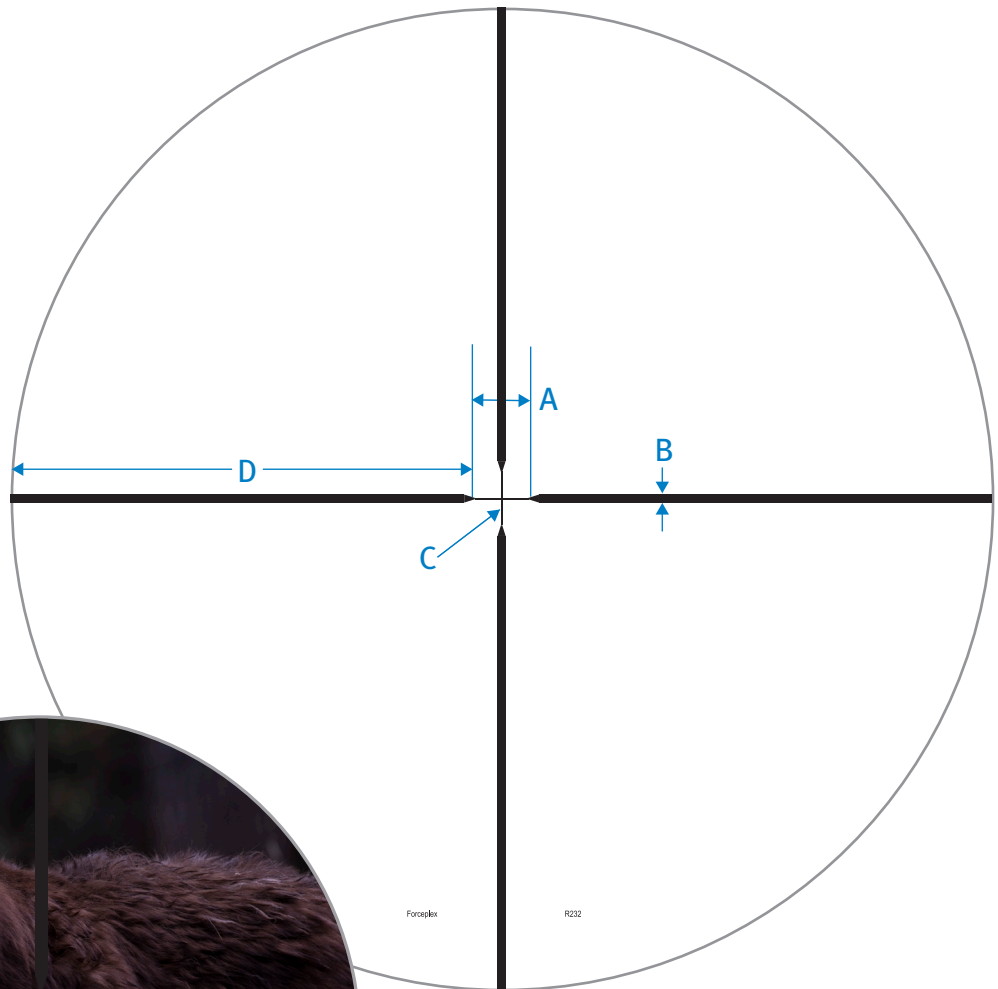

The Nightforce Forceplex™ reticle was created by and for hunters. Designed with direct customer feedback, it is simple and uncomplicated, with a clean, unobstructed field of view. The fourplex design has long been prized by hunters around the world for the way the heavier lines center your eye quickly on the target...yet we've made no compromises on precision, with 0.125 MOA thick center crosshairs that allow precise shot placement on the smallest target—even at extended distances.

The Nightforce Forceplex™ is available in illuminated and non-illuminated versions, depending upon the SHV™ rifle scope you choose. It is superb in low-light environments, and will serve you well on any game, from the dense forests of North America to the vast plains of Africa.

Reticle subtensions

A	5.00 MOA
B	0.75 MOA
C	0.125 MOA
D	43.50 MOA

- Created specifically for Nightforce second focal plane SHV™ riflescopes
- Excels in virtually any hunting situation and environment
- Extremely fast and responsive when quick shots are required, yet allows highly precise shot placement on small targets at long ranges

The illuminated center crosshairs provide a precise aiming point at dawn, at dusk, and in other difficult light when black crosshairs can disappear against the dark body of an animal.
